

Millennium Box is our corrugated cardboard solution designed specifically to meet the logistical demands of transporting and stacking fruit and vegetables.

It has been recognised with the Liderpack 2023 Award for its structural innovation. A sturdy, functional and secure packaging solution, designed to improve the logistics of fresh produce. Thanks to this innovation, peeling, breakage and damage during handling are significantly reduced, ensuring that products arrive in optimal condition. In addition to protecting the goods, Millennium Box saves logistics costs by being optimised to make the most of space and facilitate safer and more efficient transport.

Preservation

Millennium Box helps keep products in perfect condition during transport thanks to its sturdy structure and its ability to minimise impacts. Its stability when stacked prevents sudden movements and protects the fruit and vegetables against shocks or excessive strapping pressure.

This design ensures that the integrity and presentation of fresh produce are maintained right up to its destination.

- Enhanced protection during transport
- Stable stacking that prevents crushing and knocks

Safety and logistics

Its innovative structure allows for more stable stacking, as the tabs fit together precisely, preventing movement during transport. This increased stability reduces the likelihood of slippage, falls or breakages during loading, unloading and storage.

Furthermore, the strength of the packaging minimises common issues such as peeling off or deformation during handling, resulting in less wastage and a safer and more efficient distribution.

- Innovative design for stable stacking
- High structural strength during transport
- Improved load security during transport

Sustainability

Millennium Box is made from 100% recyclable corrugated cardboard. Its structure is designed to provide strength without the need for additional materials such as tape or plastic reinforcements, which makes it easier to recycle and reduces the packaging's environmental impact.

Through this efficient design, brands can reduce the use of unnecessary materials and make progress towards their sustainability commitments, without compromising on product protection or logistical efficiency.

- 100% made from recyclable cardboard
- Optimised structure with no additional components
- Easy to recycle after use
